IPv4

1980s Add. concept

PAGE NO.:

DATE: 05/08/22

Internet protocol version 4 (1983)

▷ The IPv4 address is 32-bit number that uniquely identifies a network interface on a machine.

* classful addressing :-

▷ class 'A'	0-127	128	
▷ class 'B'	128-191	64	
▷ class 'C'	192-223	32	2
▷ class 'D'	224-239	16	2 ⁴
▷ class 'E'	240-255	16	2 ⁴

▷ classes and blocks :-

class A	Network ID 8	Host ID 8	Host ID 8	Host ID 8	⇒ 2 ²⁴ - user possible
class B	N	N	H	H	⇒ 2 ¹⁶
class C	N	N	N	H	⇒ 2 ⁸

CLASS A

class 'A' in IP Addressing

this bit is fixed as 1 to identify class.

* No. of Total IP Add. in class 'A' is 2^{31} .

No. of Networks in class 'A' = $2^7 (128) - 2 = 126$

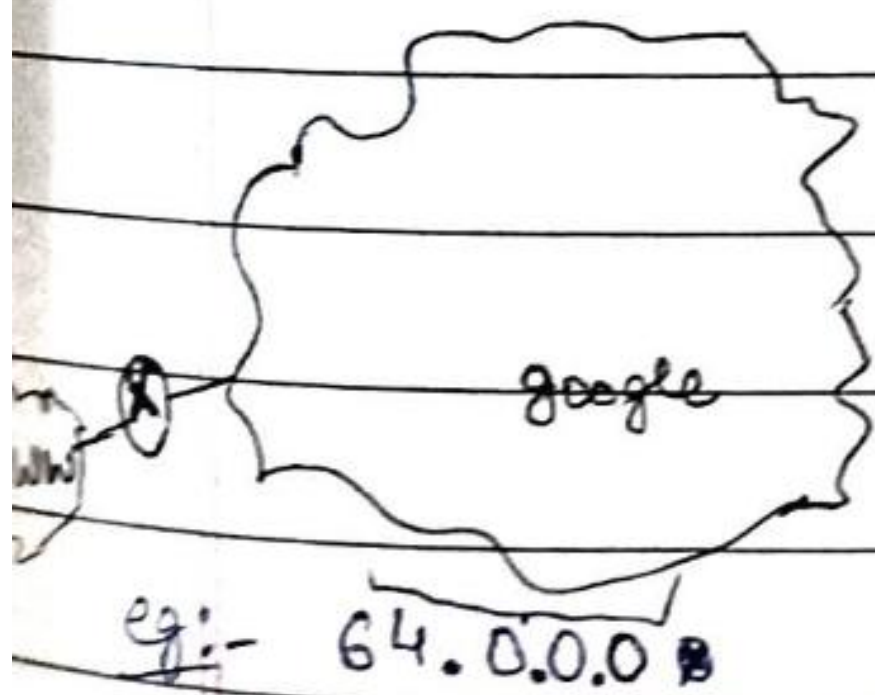

⇒ first '00000000' and '11111111' (0 & 127) doesn't assigned for any organization. So

IANA holds these (0 & 127) for 'loopback' or 'Diagno. purpose'

⇒ Total No. of Host possible in class 'A' is $(2^{24} - 2)$

* Because first and last is reserved as a Broadcast with last add (127) & first for 'own' identifiat.

▷ 64.255.255.255 if class 'A's last three octet is 111 (All 1) it is known for "Broadcast"

⇒ Default Mask of Class 'A' = 255.0.0.0 it used to get class belongs to.

eg] IP:- 64.0.0.6

Binary:- 010000000.0.0.00000110

Mask:- 11111111.0.0.00000000

} 'AND' op.

010000000.0.0.00000000

M
S/CN

Total: (65536) CLASS B (128 - 191)

* class 'B' in IPv4

* Fixed to identify class.

▷ Range :- 128 - 191. ▷ No. of Networks :- 2^{14}
= (16384)
▷ No. of addresses = 2^{30} (1 Billion)

* No. of Hosts possible in each Network :- $(2^{16} - 2) = 65536$
→ (65534) useful

Eg:- 128.0.0.0 {0.0} these bits are denotes itself;
128.0.0.255 :- Reserved for 'Broadcast Purpose'

→ Default Mask in 'B' - 255.255.0.0

in Binary:- 11111111.11111111.00000000.00000000

Ex To get Network ID = ~~Subnet~~ Default Mask (AND) Give Address:-

130.2.4.5
'AND' 255.255.0.0
130.2.0.0 :- Network ID

** Maximum length (In Bytes) of IPv4 datagram :- 65535.

CLASS-C

(192-223) 32

PAGE NO.:

DATE:

* class 'C' in IPv4

Range :- (192-223)

* No. of Networks :- 2^{21} (2,097,152) :- 5+16 bit = 21

* No. of IP Addresses in class 'C' = 2^{29} = 12.5%

* No. of possible host = (Total - 2) :- (256 - 2) = 254

⇒ Default Mask :- 255.255.255.0
in 'C' = 11111111.11111111.11111111.0

Eg:- Add. = 195.2.3.8

'AND' 255.255.255.0

195.2.3.0 is Network ID

ABC
in class 'C'

195.2.3.0 "Identification ID of ABC"

195.2.3.255 "Broad cast of ABC"

(240 - 255)
 CLASS-E / D (224 - 239)

* class 'D' in IPv4

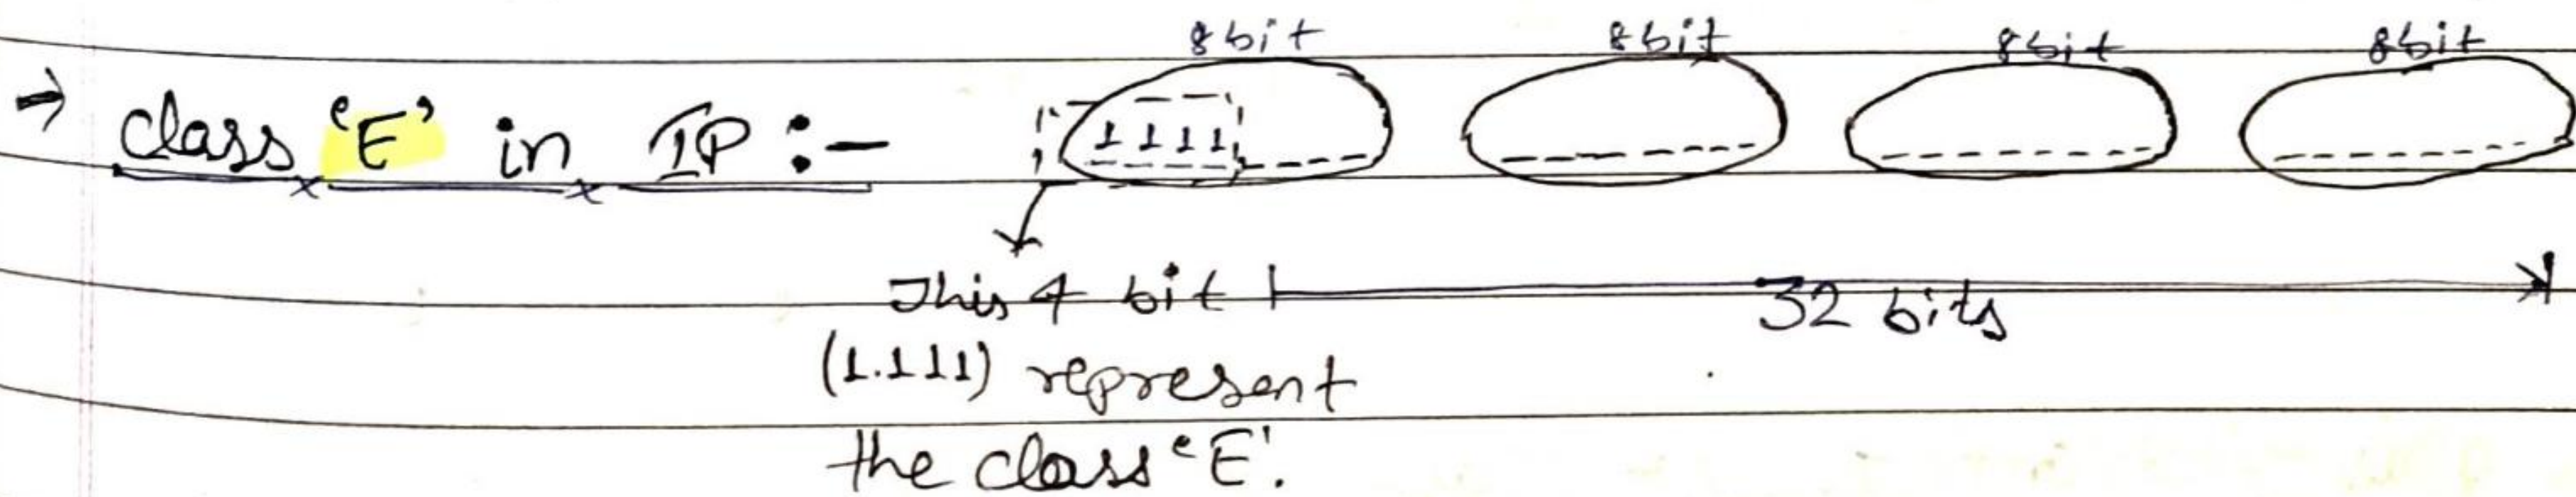

32

* class 'E' in IPv4

This 4 bit
 1110 0000
 1110 0001
 1110 0010
 1110 0011
 1110 0100
 1110 0101
 1110 0110
 1110 0111
 1110 1000
 1110 1001
 1110 1010
 1110 1011
 1110 1100
 1110 1101
 1110 1110
 1110 1111

No. of IP addresses possible in 'D'
 $= 2^{32} - 2^4 = 2^{28}$

Δ 'D' is reserved for Multicasting, group Email/Broadcast

* No. of IP addresses possible in 'E' = 2^{28} = ()

* # Reserved for Military purpose

C.N

GATE/UGC questions.

IPv4 Classful

Q 1) IP Address 201.20.30.40

- * calculate network ID :- get 201.20.30.0
- * " 4th Host ID :- 201.20.30.4 is in 4th place
- * " Last Host ID :- 201.20.30.254 (because last is not for host)
- * " Broadcast ID :- 201.20.30.255

1st step Identify class :- 201.20.30.40
class-C

2nd :- ~~Def~~ Default mask is :- 255.255.255.0

Then 'AND' operation b/w IP & Default Mask

201.20.30.40
AND 255.255.255.0
201.20.30.0 \rightarrow Net ID

* Two types Broadcast :-
 \rightarrow Limited :- 255.255.255.255 (It always same)
 \rightarrow Direct :- 201.20.30.255 (according to this net)

* Dis-Advantage of Classful :-
• wastage of IP address.
• Maintenance is time consuming
• More Prone to errors
* Security.

Note :- This is why classless Addressing introduced to minimize the wastage of IP.

CLASSLESS (1993) CIDR Addressing in IPv4

PAGE NO.: 78
DATE: 5/8/

No classes is here.

only blocks According to demand.

* Notation: $x.y.z.w/m$

eg. 200.10.20.40(28)

mask no. of bits represent block/network

Host ID = Total - m

$$32 - 28 = 4 \text{ bit}$$

$$= 2^4 = \text{Host ID}$$

* Here, Default Mask depends on m value above is 28 So:-

(28 times) '1' - 11111111.11111111.11111111.11110000

$$\text{Mask} = 255.255.255.240$$

To check given IP address's Network ID.

1 way:- given 200.10.20.00101000 :- Open only last Decimal.

Last part Step 2: change as '0000' 00010000 convert in decimal.

Network ID is :- 200.10.20.32

Rules:- 1. Address should be contiguous.

2. No. of address in a block must be in power of 2.

3. First address of every block must be evenly divisible with size of blocks.

2 way:- first write down

Default Mask:- (above) 255.255.255.240

Then Do (AND) operation With given/question IP address

$$\text{So, } 255.255.255.240 \text{ AND } 200.10.20.40$$

$$\text{Ans} = 255.10.20.32$$
